

Statement of Motorola's Position on Global Climate Change

Motorola recognizes that human actions may be influencing global climate change and we have had initiatives to address this for several years. In 1999, we established an aggressive goal to reduce our emissions of PFCs (perfluorocarbons) -- the largest source of greenhouse gasses -- by 50 percent worldwide by 2010. Motorola achieved the goal in 2003, well ahead of schedule. Also, we are a founding member of the Chicago Climate Exchange, an innovative voluntary initiative to reduce emissions. To be transparent about our actions, we participate in the Carbon Disclosure Project (CDP). The CDP is an initiative led by institutional investors around the world in cooperation with various government and non-governmental organizations to encourage companies to report on their emission of greenhouse gases and their strategies for examining the potential impacts of the global warming issue on their business risks, opportunities, and practices.
